

Forensic Sil

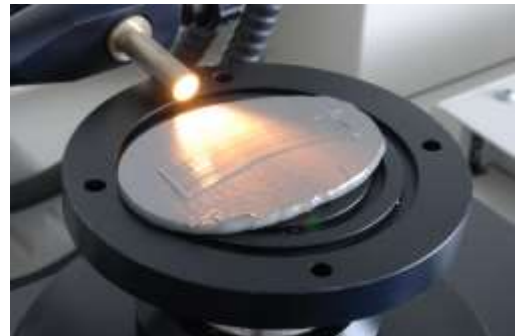

THE NEW AND IMPROVED FORENSIC SIL NOW AVAILABLE

Ever since its introduction 5 years ago our non-toxic Forensic Sil has proved itself to be an excellent material for making detailed imprints. Since then tens of thousands imprints, such as tool marks, finger marks and bite marks have been made with Forensic Sil, because of the following advantages:

- Non-toxic (thixotropic polyvinyl siloxane)
- Quick and very simple application
- Suitable for comparison with imprints made earlier
- Constant mixing ratio by use of a mixing tip
- Flexible and shrink proof, so dimensionally stable
- During and after setting no by-products (moisture) are produced

Nevertheless, even a good product can be improved and we have therefore made some changes, partly based on the few remarks we received from crime scene officers/ forensic laboratories. One was the setting time, which we were able to reduce by 10%, another was the color, which was adjusted to a slightly lighter grey.

Furthermore, the material is now even more flexible and has a greater tear strength thus reducing the chance of damage when removing imprints from marks.

Finally we have made changes in the packaging: the size of the cartridge has been reduced from 75ml to 50 ml, thus limiting the space the cartridges take and each box now contains 10 cartridges and 50 mixing tips.

Remark:

The 50ml cartridge can be used in the same dispenser gun with the 75ml plunger.
